A CONTINUOUS QUALITY IMPROVEMENT PROGRAM TO HELP EMS IMPROVE SURVIVAL FROM CARDIAC ARREST

On Scene, High-Quality CPR is the single highest determinant of survival from cardiac arrest.

How do you ensure that your agency is competent to deliver High-Quality CPR every day, in every cardiac arrest call?

Low-dose, high-frequency learning practices are significantly more effective at increasing and verifying competence.

RQI shifts from a traditional 2-year compliance mindset to one of mastery learning with verified skills competence, establishing the new standard of care – verified CPR competence.

Resuscitation Quality Improvement EMS provides a high-reliability platform for simulation-based mastery learning, implemented through low-dose, high-frequency quality improvement sessions that measure and verify competence.
RQI EMS is the only program that delivers the new standard of care – verified CPR competence – to the prehospital provider.

Prep Assignment provides additional cognitive modules for learners who need more information or a refresher course.

Entry Assignment allows experienced providers to prove their resuscitation knowledge and skills.

RQI eCredential is an American Heart Association-backed verification of a learner’s demonstrated competence in High-Quality CPR skills and knowledge.

Learners begin a curriculum tailored to their practice needs.

Simulation stations are deployed at locations that are conveniently accessed 24/7 by learners, allowing quarterly spaced learning and skills training modules to be completed during the normal shift.
